Earth's internal thermal energy causing mantle to heat, expand, and rise. As it gets closer to crust it cools, becoming denser and sinking forming a current. The convection currents act as a "conveyor belt" moving the plates of the lithosphere above. The result of plates moving are earthquakes, volcanic eruptions, and building of mountains.

Warmed by the blazing-hot core, the mantle churns in circular convection currents, dragging tectonic plates along for the ride. Today, plate tectonics is the unifying theory of the entire field of geology. It explains the rock cycle, the origin of Earth's surface features, and the cause of seismic activity, such as earthquakes and volcanoes.
